

BA BM

Backflow preventer with verifiable reduced pressure zone
with funnel incorporated

Technical Data Sheet

Description

The BA BM backflow preventer protects the drinking water network by interrupting the continuity of the supply, emptying and evacuating to waste in case of danger of water being turned back into the main pipeline.

- Easy maintenance thanks to modular sub-sets
- Compact design and space-saving
- Piston technology on the relief valve, without membrane: easy mounting/dismantling, reinforced longevity
- Reduced head losses
- Easy access
- High quality materials
- Connection: Male threaded union nuts (BSP) ISO 228-1

Approvals

International Construction Standards:

EN 1717 - EN12729 P-IX870/1

Thread connection according to EN ISO 228-1 / ISO 7.1

Application

Designed to protect drinking water supply networks against the backflow of risk fluids up to category 4 according to EN1717.

The device is designed to prevent any backflow of polluted water into the drinking water supply network as a result of back pressure or back siphonage when the pressure upstream of the device is lower than the pressure downstream of it.

For systems liable to generate pollution risks such as:

- Professional networks: industrial facilities, surface treatment, chemical industry
- Sanitary networks: hospitals, laboratories, dialysis centers, water treatment
- Technical networks: heating, air conditioning, irrigation, water dispensers, sprinklers

Installation

Directions for installation:

- total accessibility
- non-submersible installation
- purge carefully all air from the installation(non polluted atmosphere)
- the discharge valve must be able to cope with the discharge flow rate
- protection against frost or extreme temperatures
- in the case of an upstream diversion in the area right in front of the RPZ, it is necessary to install a check valve between the diversion and the RPZ.
- always manipulate the upstream valve slowly.

The protection device must be installed by a qualified technician.

Installation specification :

The correct installation requires:

- upstream : ball valve fitting + filter (with drain cock)
- downstream : ball valve fitting

Maintenance

• Testing: In accordance with national statutory regulations, BA backflow preventers must be regularly inspected(once a year in most countries) by an authorized maintenance technician.

An annual functional test of the backflow preventer must be done with a test kit with pressure gauge and hoses. This test equipment must be checked once every two years at least.

• Repair kits: Repair kits are available and make it possible to replace the specific defective part on the BA backflow preventer. The kit consists of: one upstream valve assembly(1), one downstream valve assembly(2), one relief valve assembly(3).
