Air valve

Eurus

Presentation

Advantages

Triple-function combined air valve: air discharge, air intake, and automatic air venting.

- Single chamber with optimized design for better air flow.
- Ductile iron body with full passage, stainless steel cap, precise float guidance, maximum admissible pressure of 40 bar.
- Air flow calculations for optimal intake or discharge. Tangential drainage for quick and complete emptying.
- Cylindrical floats performing high-flow functions and maintaining pressure during operation.
- Float replacement can be easily carried out through the cap.
- Stainless steel plate beneath the float to eliminate the impact of surges or water hammer on the floats.
- Adaptable and interchangeable stainless steel nozzle according to the valve model.
- Standard stainless steel protection grid to prevent the entry of foreign objects (insects, etc.). Optional umbrella-shaped ventilation grid.

Specifications

Design and technical data

DN mm	DN 50 - DN 300
DN inch	2 - 12 "
Temperature	0°C to 70°C
Type of body	Flanged
Application	<ul style="list-style-type: none">• Water distribution networks.• Irrigation or fire systems.• Used at high points on slope changes in pipelines.
Flange	PN10, PN16, PN25, PN40
Flange standard	BS EN1092-2 PN10-16-25-40 ANSI Class 125-150-250
Design and Test Standard	EN-1074/4* AWWA C-512
Pressure	Minimum 0.2 bar (lower on request) - maximum 40 bar
Option	Customized changes on the flanges and painting on request.

* Resistance and tightness of the body (1.5 x allowable operating pressure), Tightness of the seat, (1.1 x allowable operating pressure)

4-function air valve

▼ Large volume air discharge:

When filling the pipe, it's essential to release air while water enters. The A400 and A400X equipped with an aerodynamic full-port body and deflector, ensures the prevention premature closures of the mobile block during this phase.

► Regulated Outflow:

During pipe filling, if the differential air pressure surpasses a specific threshold without control, there is a potential risk of water hammer and system damage. In such a scenario, the PP top float will automatically rise, diminishing the outflow and consequently slowing down the velocity of the advancing water column.

◀ Air Release in Operational Conditions:

While in operation, the air generated by the pipeline accumulates in the upper section of the air valve. Gradually, it undergoes compression, and the pressure reaches the water pressure level. Consequently, its volume expands, pushing the water level downward and facilitating the release of air through the nozzle, down the velocity of the advancing water column.

▼ Inflow of Significant Air Volume:

During pipeline drainage or pipe bursts, it is essential to introduce an equivalent amount of air as the outflowing water to prevent negative pressure and potential serious damage to the pipeline and the entire system.

3-function air valve

Large volume air discharge:

When filling the pipe, it's essential to release air while water enters. The A300 and A300X equipped with an aerodynamic full-port body and deflector, ensures the prevention premature closures of the mobile block during this phase.

Air Release in Operational Conditions:

While in operation, the air generated by the pipeline accumulates in the upper section of the air valve. Gradually, it undergoes compression, and the pressure reaches the water pressure level. Consequently, its volume expands, pushing the water level downward and facilitating the release of air through the nozzle. down the velocity of the advancing water column.

Inflow of Significant Air Volume:

During pipeline drainage or pipe bursts, it is essential to introduce an equivalent amount of air as the outflowing water to prevent negative pressure and potential serious damage to the pipeline and the entire system.

Air performance

AIR DISCHARGE DURING PIPE FILLING

AIR ENTRANCE DURING PIPE DRAINING

AIR DISCHARGE DURING PIPE FILLING

AIR ENTRANCE DURING PIPE DRAINING

Installation

Vertical Vortex Pump Application

Well Application

Centrifugal Pump Application

Application in a Network

Installation

The installation

- The recommended equipment is vital for safety during filing and maintenance, as well as for the satisfactory operation of the valve.
- For the purposes of illustration, we will look at the case of a Neptune pressure reducing valve. In the case, the air valve is fitted downstream if the pipe runs downwards to the stabiliser or upstream if the pipe runs upwards to the stabiliser.

Additional products

Micro air valve - 2-function air mini air valve
